@print.that.ship

I can confirm that this thing flies exceptionally well & has very minimal vibrations. I had it running 1404 3500Kv motors, 4s 850 lipo, 3.5x2.8x3 props, analog. it took crashes very well but I did hit a tree going about 65+mph & that ended that flight.

2024-10-30 22:07 16 Reply

@Theo4011

pretty sweet that's all the damage there was, nice you can just print a new frame or even have a backup ready to go..

2024-11-11 11:27 3 Reply

@menefee_family

I am a beginner to drone stuff how should I go about building one with this frame. Like what parts would I need to buy to get this up and running. Please and thank you.

hi !! I have 1404 ECO motors from EMAX. make sure motors are 9mm spacing. I made the mistake of buying 12mm spacing 1404 motors. for flight controller I have a speedybee AIO & it's perfect for 4s . I have ELRS receiver from happy model and props are EMAX Avant props. they are originally for the baby hawk 2 . I have a ZEUS VTX and a lollipop antena for said VTX . runcam racer 2 camera . hope this helps

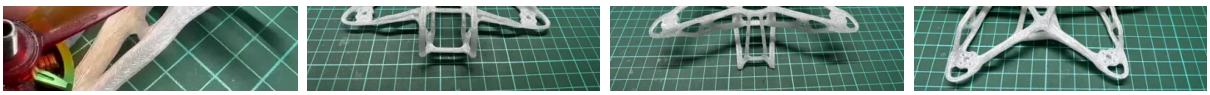
@PabloSemper

Hello!!. I would like to congratulate the creator who thought of this model, it is GREAT!!!.
To be clear, I did two tests. In PP-T (Polypropylene), FDM printer, I managed to make two frames. One of 3.5" and another of 5". In the first one, the pattern or layout of the motor mount is 9x9, so I don't have motors with those characteristics. So I decided to make the 5" one in the same PP-T material. I attach a video of the problem I have and it is that the blades of the propellers touch the frame, is it an older version that I printed by mistake???. What could be the problem???. THANKS!!!!!!



2024-06-29 05:31 The designer has replied 5 Reply

@PecaJosef

The design unfortunately does not support all motor sizes. It was made for Xing-E 2207 so smaller motors will have some problems with props touching the frame. However it should be possible to print some spacers to lift the motor up a bit.

2024-06-29 06:12 1 Reply

@PabloSemper

Replying to @PecaJosef :
Hello!! Thanks for answering!!!. Well, that's understandable. I'll make a spacer to improve that detail. I'll show you later how it's going. I'll be waiting for any changes and to be up to date with this great project. THANK YOU!!!!

2024-06-29 06:41 1 Reply

@WAFFLEMAN

I love the generative design organic look! when I build my drone I will use this!

2025-03-25 07:17 0 Reply

@korv55

Super impressed with this frame! I built my own version, adding a Raspberry Pi Zero case and a holder for my GPS and built a fully autonomous drone using ArduPilot. Survived multiple crashes and if it doesn't, I can just print a new one!

I had to, as others pointed out, put the motor
mounts a few millimeters up for my motors to not rub against the sides when spinning.

I also added a custom battery holder and some tiny landing legs.

2025-05-19 18:03 4 Reply

@user_2303778017

Whats the purpose of the RPI? Are you using Mavlink or DDS? And 915mhz radio for communication with Ground station? So cool love this!

2025-07-25 13:11 0 Reply

@korv55

Replying to @user_2303778017 :
I use it to replace the USB-cable to my computer so that I can arm/disarm, configure, change routes etc with SidePilot or QGroundStation mobile apps. I have no radio communication with it at all - when it is in the air I cannot control it at all.

2025-07-27 17:53 0 Reply

@user_1428625688

omg do you have those motor spacers. i have 16x19 2205, can't match the holes or the height.

2025-09-05 09:24 0 Reply

Is there a list of parts I can get? I am only 12.

2025-01-06 02:50 11 Reply

@S.janatzek1988 Boosted

3" and 3,5" in ASA 0,2mm x 6walls 30% Gyroid + Support = ca. 8h/print

I'm toying with the idea of having one of them printed in HP-PA or aluminum, but I'm a bit unsure whether the frame won't become too heavy with the SLS or SLM process due to the unmelted residues.. would it be possible to include the thickness of the materials in the model calculation?

2024-05-14 14:27 The designer has replied 3 Reply

@PecaJosef

If you print it in SLA Nylon (PA12) it is going to be very lightweight at 50g for the 3.5 inch (see the pictures below). However the aluminum is not a great choice because it would be slightly over 126g for the same design.

2024-05-17 19:31 1 Reply

@user_2243220858

Replying to @PecaJosef :
do you need any supports or print in place?

2024-05-22 00:35 0 Reply

@PecaJosef

Replying to @user_2243220858 :
SLS 3D printing does not need supports unlike regular FDM 3D printing where it is necessary to use them for designs like this drone frame.

2024-05-22 01:15 0 Reply

@Michael_Fpv

Would it be possible to also install a DJI O3? can you adapt the design for this?
I would like to print it in aluminum in my company

2024-06-04 00:11 The designer has replied 0 Reply

@PecaJosef

Sure, which version? I am probably not gonna let it generate all over again but I will try to redo the camera mount.

@Encrust3d Boosted

Print Profile 0.2mm layer, 3 walls, 60% infill Gyroid ★★★★☆

Frane flexes a little but not too bad, I did six walls. I had to cut the frame some on the front two motor holes to fit 2207 motors though. 20x20 and 30x30 mounts are appreciated, had just enough room to mount my hd zero vtx and 30x30 stack. camera mount was a little wide for the runcam but I got it to work. my first five inch I've built and it rips. printed on a H2D in petg with pla as supports. camera mount failed on the first print, was able to get it to print fine the second time around.

@llanterner

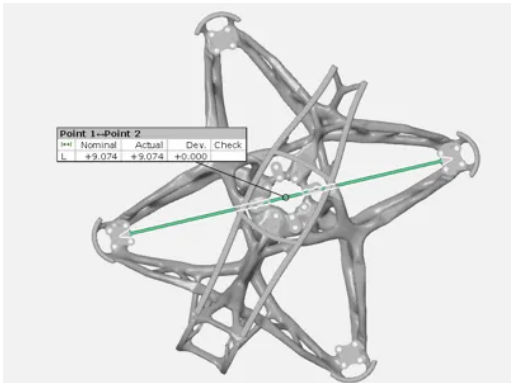
Printed in PETG CF with PLA supports
Very light and strong
Thanks for the design

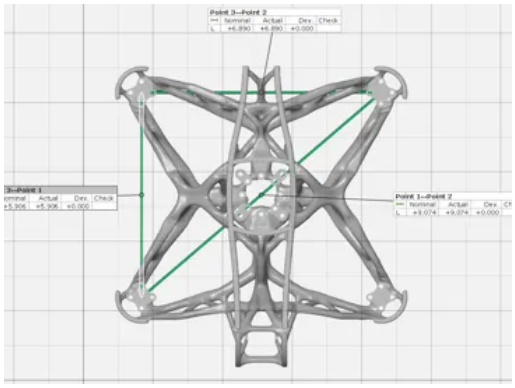
2024-10-11 13:45 Show original 2 Reply

@Tradesofalljosh

It says 5 inch drone, but maybe I don't understand. When I measure diagonally I get 9" from center of motor to center of motor. Is this a scaling issue? Or is it just the prop size used?

(Edited)





2024-07-18 02:13 The designer has replied 0 Reply

@PecaJosef

5inch means it is for 5inch props not the motor to motor dimension.

2024-07-18 23:57 3 Reply

Here is your 3.5" printed in American Filament Blue PLA+. Turned out very well! It's for my buddy who is big into drones. He's going to build it and fly it!

2024-07-19 07:24 1 Reply

@user_1428625688

Great frame, but like someone stated in the comments I had problems with these motors being smaller and the holes not matching. Is it possible to get the f3d file so i can edit it and add some stuff?

I'm not sure if i can edit this using the stl file in fusion360, i would probably need a supercomputer to put it back to f3d.

2025-11-21 08:33 The designer has replied 0 Reply

@PecaJosef

I have uploaded f3d files as well as step files so it should be possible to download them and edit it.

2025-11-21 08:44 0 Reply

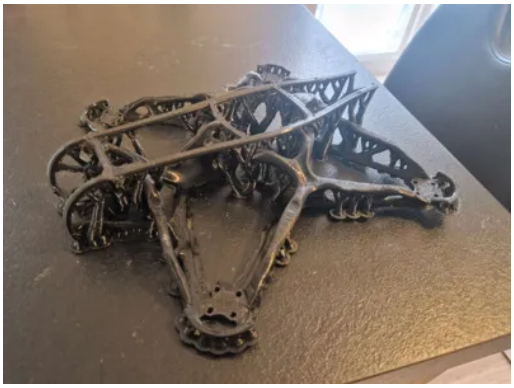
@Jayko

Print Profile 0.2mm layer, 3 walls, 60% infill Gyroid

Support Issue: Printed it in PA6.6 and the ginormous amout of support makes it difficult to remove them. cant even use interface material

Bed Adhesion Issue: Due to some of the supports being quite small they get knocked over and it creats a mess

Missing Model Parts: Cameramount is missing. There should be some parts for different standard fpv cameras.



2025-05-22 14:57 3 Reply

@myRmur Boosted

great design! chose the 5" model.

had to make a few edits to support:
* motors with 8mm mounting holes and FC/VTX mounts of 25mm.
* had to make a mounting adapter for my VTX because my FC wants to be rotated 45degrees.
* had to edit arms because they were getting in the way of the props.

@user_2914047390

Hello, the print is great, with the appropriate supports and the drone positioned correctly, a fantastic piece results. The problem I encountered is that once printed, when I went to mount the motors, the distance between the four holes where the screws are inserted into the printed drone is 14 mm, and that of my motors is 16 mm, therefore, I cannot correctly fasten them. It's a shame; I've been left wanting to fly this frame, even so, it's a brilliant design, thank you to the creator for sharing it

Print Profile 0.2mm layer, 3 walls, 60% infill Gyroid ★★★★★

@user_1876938213 Boosted

looks dope

2025-01-17 01:47 0 Reply

@PuffTheMagic

I have been trying to print these at different orientations to get the cleanest print on my X1C. So far the best results have come from printing it on its nose at about 70 deg. I am using 1 wall but at double the width to help with the overhangs. So far with PLA+ the 3.5" and 5" models are coming in at 50g and 90g respectively. Using the same settings with ASA this should be stronger and lighter :D

Print Profile 0.2mm layer, 3 walls, 60% infill Gyroid ★★★★★

2024-04-07 21:39 1 Reply

@PecaJosef

I would increase the infil to at least 50-70% to make it more sturdy. And printed with at least 3 walls.

Print Profile 0.2mm layer, 3 walls, 60% infill Gyroid ★★

Other Issues: I don´t now how or why but this model I print whit PET-G (model) and PLA (supports) and I can´t print it correctly

Print Profile 0.2mm layer, 3 walls, 60% infill Gyroid ★

(Edited)

Bed Adhesion Issue: the part is unfortunately too uneven

Support Issue: due to the unevenness, Bambu has problems generating proper supports
5/5 prints have failed

Print Profile 0.2mm layer, 3 walls, 60% infill Gyroid ★☆☆☆☆

Bed Adhesion Issue: not enough primary layer for the drone to have enough of the bed to stick to that 60 infill and not enough first layer it was coming of the bed bad.
